OOP with Java
Homework 02: Arrays and I/O

website

- We want to practice I/O, i.e., reading of input and writing of output data
- We want to practice working with arrays
- This homework is comprised of one task
- Send me a zip archive named `hw02_[your_student_id].zip` (where `[your_student_id]` is replaced with your student id) with one answer-folder for each homework task (names `hw02-1`)

- Write a Java program which

- Write a Java program which:
    - Prints a greeting to the user to `System.err`, stating that it is a program for adding matrices

- Write a Java program which:
    - Prints a greeting to the user to `System.err`, stating that it is a program for adding matrices
    - Asks the user for the "width" of the matrices via `System.err` (and reads the width as `int` from the input)

- Write a Java program which:
    - Prints a greeting to the user to `System.err`, stating that it is a program for adding matrices
    - Asks the user for the "width" of the matrices via `System.err` (and reads the width as `int` from the input)
    - Asks the user for the "height" of the matrices via `System.err` (and reads the height as `int` from the input)

- Write a Java program which:
  - Prints a greeting to the user to `System.err`, stating that it is a program for adding matrices
  - Asks the user for the "width" of the matrices via `System.err` (and reads the width as `int` from the input)
  - Asks the user for the "height" of the matrices via `System.err` (and reads the height as `int` from the input)
  - Allocates a two-dimensional array of type `double[height][width]`

- Write a Java program which:
  - Prints a greeting to the user to `System.err` , stating that it is a program for adding matrices
  - Asks the user for the "width" of the matrices via `System.err` (and reads the width as `int` from the input)
  - Asks the user for the "height" of the matrices via `System.err` (and reads the height as `int` from the input)
  - Allocates a two-dimensional array of type `double[height][width]`
  - Reads the `height*width` numbers row by row into the array

- Write a Java program which:
    - Prints a greeting to the user to `System.err` , stating that it is a program for adding matrices
    - Asks the user for the "width" of the matrices via `System.err` (and reads the width as `int` from the input)
    - Asks the user for the "height" of the matrices via `System.err` (and reads the height as `int` from the input)
    - Allocates a two-dimensional array of type `double[height][width]`
    - Reads the `height*width` numbers row by row into the array
    - Repeats the above step for the second matrix

- Write a Java program which:
    - Prints a greeting to the user to `System.err`, stating that it is a program for adding matrices
    - Asks the user for the "width" of the matrices via `System.err` (and reads the width as `int` from the input)
    - Asks the user for the "height" of the matrices via `System.err` (and reads the height as `int` from the input)
    - Allocates a two-dimensional array of type `double[height][width]`
    - Reads the `height*width` numbers row by row into the array
    - Repeats the above step for the second matrix
    - Allocates a new `double[][]` two-dimensional array of proper size to receive the result

- Write a Java program which:
  - Prints a greeting to the user to `System.err`, stating that it is a program for adding matrices
  - Asks the user for the "width" of the matrices via `System.err` (and reads the width as `int` from the input)
  - Asks the user for the "height" of the matrices via `System.err` (and reads the height as `int` from the input)
  - Allocates a two-dimensional array of type `double[height][width]`
  - Reads the `height*width` numbers row by row into the array
  - Repeats the above step for the second matrix
  - Allocates a new `double[][]` two-dimensional array of proper size to receive the result
  - Adds the two matrices that were read and stores the result in the freshly allocated array

- Write a Java program which:
  - Prints a greeting to the user to `System.err`, stating that it is a program for adding matrices
  - Asks the user for the "width" of the matrices via `System.err` (and reads the width as `int` from the input)
  - Asks the user for the "height" of the matrices via `System.err` (and reads the height as `int` from the input)
  - Allocates a two-dimensional array of type `double[height][width]`
  - Reads the `height*width` numbers row by row into the array
  - Repeats the above step for the second matrix
  - Allocates a new `double[][]` two-dimensional array of proper size to receive the result
  - Adds the two matrices that were read and stores the result in the freshly allocated array
  - Prints the resulting matrix row by row to `System.out`

- Write a Java program which:
    - Prints a greeting to the user to `System.err`, stating that it is a program for adding matrices
    - Asks the user for the "width" of the matrices via `System.err` (and reads the width as `int` from the input)
    - Asks the user for the "height" of the matrices via `System.err` (and reads the height as `int` from the input)
    - Allocates a two-dimensional array of type `double[height][width]`
    - Reads the `height*width` numbers row by row into the array
    - Repeats the above step for the second matrix
    - Allocates a new `double[][]` two-dimensional array of proper size to receive the result
    - Adds the two matrices that were read and stores the result in the freshly allocated array
    - Prints the resulting matrix row by row to `System.out`
- The answer-folder for this task contains the complete Eclipse project, including source code (.java) and compiled (.class) file.

谢谢
Thank you
